

Medical Alert Notification

In student health records you can now make medical alerts viewable outside of health services. This field will be used in conjunction with the medical alert field. This will effect the information in several areas.

This field should only be marked in instances where the medical alert is deemed significant enough for all staff to know the condition, some examples would be if a student has a food allergy such as peanut butter or if a student was allergic to bee stings which could be fatal to the student. Alerts flagged for such notifications will be accessible in Food Service, Instructor Suite, Office Staff, and other applications where appropriate. See below

District Screening Referral Report

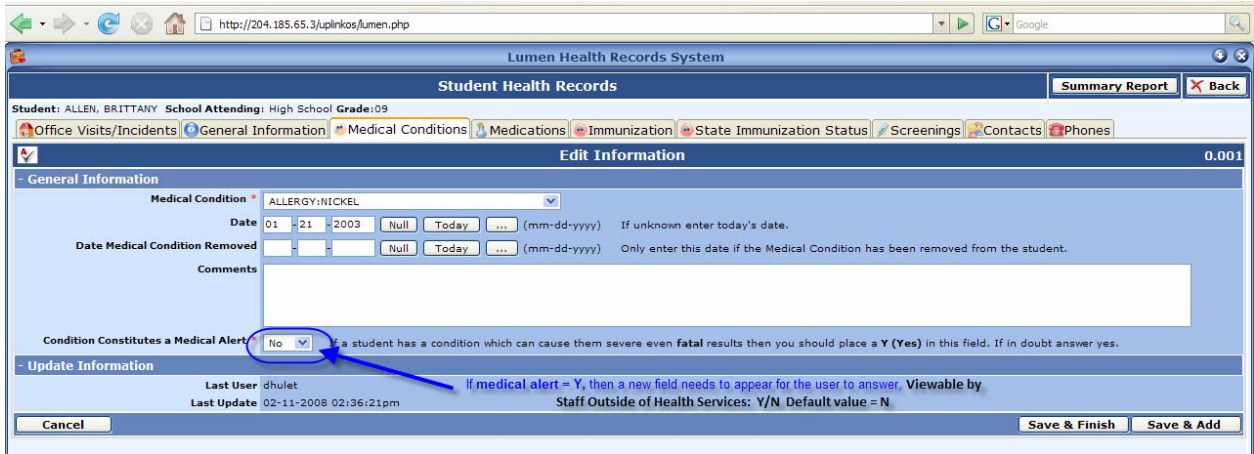

There will be reports available for district screening referrals. Only the screenings that have Referral Required and Referral Status defined in the screening management system will have the option to run these reports. Go to District -> Health Records Management -> Screening Management System-> view and set up the fields for Referral Required (yes/no) and Referral Status (Parent Inattention/Refusal, Lack of Provider). See below

Immunizations

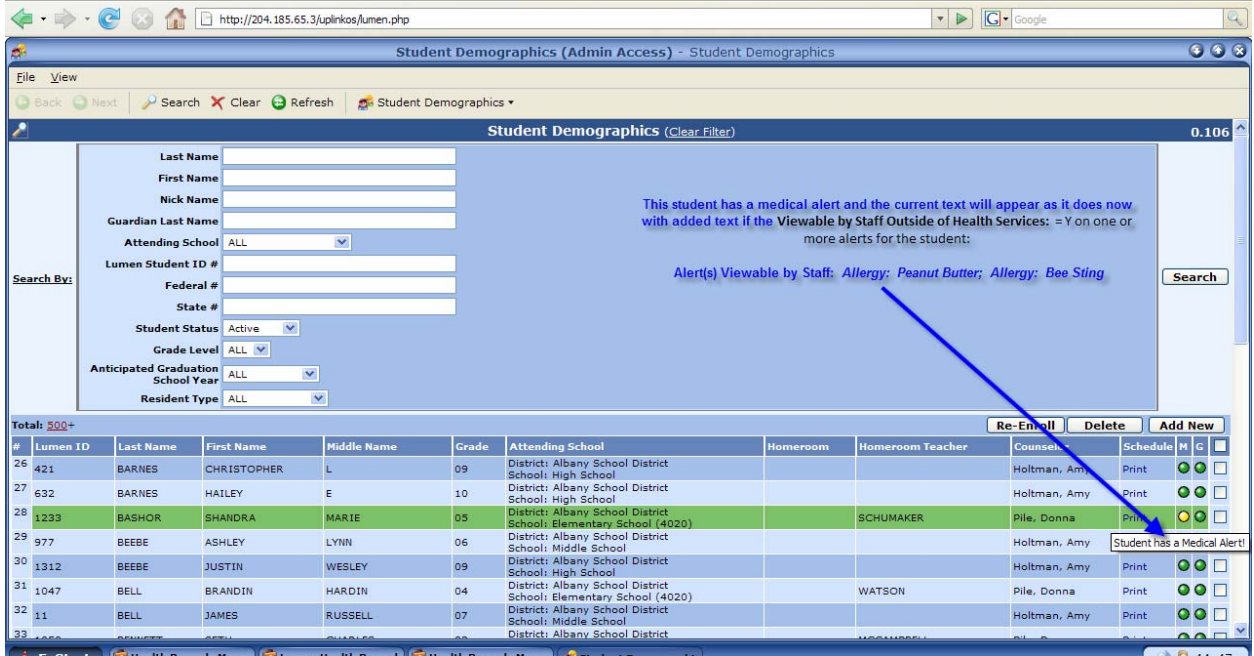

Immunizations are now grouped together by Immunization Code. The edit record icon will allow you to open the record for complete editing. You will enter a new immunization such as DTP or MMR simply by entering a date. The text (enter date and press enter key) is replaced as soon as you enter the new date (valid date). This allows you to make a quick entry into the system. See below

Medical Alert Notification

Below is example of where this will appear.

District Screening Referrals Report

Below is a screen shot of where this is found when entering a screening for a student.
